

ECOLAWN TOP DRESSER OPERATION GUIDE

Quick Start Guide

1. **Filling the Hopper** - Fill the hopper with the substrate to be spread. Make sure the feed trap is closed before doing this. No more than 440lbs should be loaded into the machine.
2. **Starting the Engine** – Before starting, make sure the conveyor system is not engaged.
3. **Topdressing with a Substrate** – Open the feed trap to the desired height (The height at which it is open determines the thickness at which it spreads). Pull the conveyor activation lever toward you and then squeeze the self-propel handle to move the spreader forward and spread the substrate.

Helpful Tips

- To help the substrate flow freely from the hopper, you may **lightly** bounce the spreader by moving it up and down while topdressing
- Start farthest away from your supply source to avoid repeated traffic over the areas you already covered
- Load the hopper gently to avoid loading compaction
- The unit functions best when the moisture content of the material is below 65%
